

Mission Control for the whole factory. **Watch every task flow from plan to code to test**, see cost and anomalies live, and act where humans already look.

CFactory Mission Control — live PARR pipeline, metrics, and event feed

WHAT SHIPPED

Mission Control

A single live view of the plan-to-code-to-test pipeline, with work items, events, anomalies, latency, and token spend.

Global command palette

Cmd-K searches across all four portals' work and opens any task instantly, with a deep-link into its cross-portal view.

Light and dark

A full Gruvbox light mode with a Dark / Light / System toggle, alongside the signature dark theme.

A 'Needs you' inbox

Every task blocked on a human — approvals, review gates, stalls — collected fleet-wide into one prioritised queue, with a badge in every portal.

Portal switcher

Plan, Build, Test, and Cockpit as one product — switch between them from a single top bar.

Live agent terminals

Streamed agent output and real token cost across all three stages, right in the cockpit.

THE PATH FORWARD

The path forward: richer live execution diagrams, sharper cost and stall detection, and a single cockpit that stays the one screen an operator needs to run the whole factory.
